Background

Regulatory developments

- Basel 2/3.
- Solvency 2.
- Pensions Regulations.

Pensions: Developments in the UK

- Pensions Act (2004): PPF and the Pensions Regulator.
- Private pension membership: 46% (1997) to 32% (2012).
- DB scheme membership: 34% (1997) to 8% (2012).

Questions:

Impact of capital requirements on individual DB pension schemes.

2 Role of the PPF for the risk management of the entire sector.

Economic Capital Formulation

Economic capital is the excess of assets over liabilities in respect of accrued benefits required to ensure that assets exceed liabilities on all future valuation dates over a specified time horizon with a prescribed high probability.

Notations:

- X_t : Net cash flow of the scheme;
- *L_t*: Value of s179 liability of the scheme;
- *I*_{s,t}: Accumulation factor;
- D_{s,t}: Discount factor.

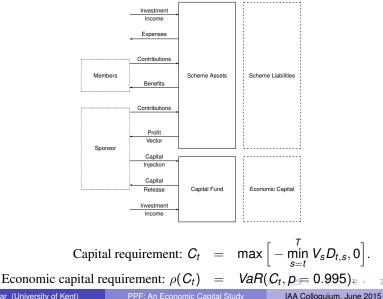

Building blocks

$$P_t = L_{t-1}I_{(t-1,t)} - X_t - L_t$$
: Profit vector, with $P_0 = -X_0 - L_0$.

 $R_t = \sum_{s=0}^{t} P_s I_{s,t}$: Accumulated retained profits until time *t*,

 $V_t = \sum_{s=t+1}^{T} P_s D_{t,s}$: Present value of future profits at time *t*.

Eligible Scheme Cashflow and Capital Requirement

Stochastic model: Economic Variables

The individual economic random variables, Z_{it} s, are modelled as:

$$Z_{it} = \mu_i + Y_{it}$$
, where $Y_{it} = \beta_i Y_{i(t-1)} + \varepsilon_{it}$ and $\varepsilon_{it} \sim N(0, \sigma_i^2)$.

The error terms

- are assumed to be independently distributed across time t;
- which are directly connected to each other are dependent;
- which are indirectly connected are still dependent, but more weakly so.

Stochastic model: Longevity

The mortality model used is developed in three steps:

- Step 1: Set S1PM and S1PF as the baseline mortality tables for males and females respectively.
- Step 2: Project these base mortality tables from year 2006 to year 2012 using the mortality projection table published by the Institute and Faculty of Actuaries.
- Step 3: Finally, model the future stochastic mortality improvements starting from 2012 by modelling stochastic uncertainty around the central mortality projection (Sweeting (2008)).

Model Points

Table : Eligible schemes model points.

Membership types	Age	Gender	Accrued service/benefit
	30	Male/Female	7 years past service
Active	40	Male/Female	16 years past service
Active	50	Male/Female	25 years past service
	60	Male/Female	34 years past service
Deferred	50	Male	Accrued pension of £3,000 per year
Deletted	50	Female	Accrued pension of £1,500 per year
Pensioner	70	Male	Pension of £6,000 per year
rensioner	70	Female	Pension of £3,000 per year

5 Results

э

Conclusions

Summary

- Aggregate economic capital requirement:
 - On eligible scheme basis: £1,200 billion.
 - For PPF: £35 billion.
- Reasonable capital buffer + shorter amortisation period can bring down the economic capital requirement further.

Need a **holistic view**, taking PPF into account, while devising regulations for defined benefit pension sector.
