International Opportunity Development of Born Global Firms:

The Role of Institutions

Abstract

Purpose

The purpose of the study is to investigate the international opportunity development process of born global firms embedded in two different institutional contexts: China, an emerging economy, and Italy, a developed country. Drawing on the entrepreneurial opportunity literature and institutional theory, this study explores and draws insights into how home country institutions of born globals can influence the international opportunity development process of the firms.

Design/Methodology/Approach

We adopt a qualitative case study approach with in-depth, semi-structured interviews of six born global companies from China and Italy. In doing so, we employ a flexible pattern matching design, which is consistent with the qualitative research design of the paper.

Findings

The findings of the study indicate that home institutions play an influential, yet differential role on the international opportunity development processes of Chinese and Italian born global firms. While the Italian firms shape their opportunities mainly through product innovation, their Chinese counterparts develop opportunities primarily through networks embedded in their home institutional context.

Originality

The key contributions of the paper relate to an integrated analysis of the international opportunity development process of born globals in China and Italy based on institutional theory, which has received limited attention in the International Entrepreneurship (IE) literature. In addition, our study advances the similarities and differences in the international opportunity development process in two different countries, thus providing valuable insights for policymakers and practitioners to enter international markets successfully.

Keywords: born global firm, institutional theory, opportunity development, internationalisation, networking, product innovation
1. INTRODUCTION

In the last decade, international opportunity development and exploitation have garnered increased attention in the international entrepreneurship (IE) literature, and, particularly, in the context of born global firms (e.g., Mainela, et al., 2018; Chandra, 2017; Hannibal et al., 2016; Chandra et al., 2012). Born global firms are unique types of entrepreneurial ventures that are globally orientated from inception and seek to derive significant competitive advantage through resource utilisation and the sale of outputs in multiple countries (Andersson et al., 2013; Coviello, 2015). In line with the definition of IE, born globals actively develop new opportunities through the “discovery, enactment, evaluation and exploitation of opportunities across national borders - to create goods and services” (Oviatt and McDougall, 2005, p. 540). Essentially, the internationalisation process of born globals can be conceived as the formation and exploitation of international entrepreneurial opportunities (Evers and Andersson, 2021).

As a central argument of IE, international opportunity has been defined as the chance to undergo an exchange with partners in new foreign markets (Ellis, 2011). International expansion typically requires the development of an opportunity. Chandra et al. (2009) note that “international opportunity recognition is the beginning of the internationalization process and deserves more systematic research attention than it has so far received because it is the trigger that starts off everything” (p. 31). More recently, the adoption of opportunity as the unit of analysis has been increasingly considered an appropriate way to examine born global internationalisation (e.g., Cavusgil and Knight, 2015; Knight and Liesch, 2016). The opportunity lens can, in fact, represent a framework to interpret the internationalisation of small companies (Covin and Miller, 2014), as opportunity can be considered a precondition of internationalisation in the analysis of the early and rapid internationalisation of firms (e.g., Chandra et al., 2009; Chandra et al., 2012). Johanson and Vahlne (2009) argue that the phenomenon of born globals becomes more understandable through an international opportunity lens. Further, they point out that the nature of this phenomenon is consistent
with the Uppsala model in the sense that “most born globals are really *born regionals*, with international activities that do not really span the globe in any significant fashion” (p. 1420). Also consistent with the Uppsala model is our argument that born globals develop new opportunities for internationalisation in a process of knowledge development, trust building, and commitment development. The only difference is that “the knowledge and the relationships might indeed be in place prior to the formal founding of the focal firm, but that is a formality of no major significance. It is true too that having those factors already in place may accelerate the process” (Johanson and Vahlne, 2009, p. 1421). Although the application of this approach has increased over the years, the international opportunity development process has generally not been widely investigated in the context of born globals (e.g., Jones *et al.*, 2011; Mainela *et al.*, 2018).

However, Alvarez *et al.* (2015) and Johanson and Vahlne (2009) argue that foreign market opportunities develop within certain institutional settings. Accordingly, IE scholars believe that this field of research should devote more attention to the institutional characteristics of a firm’s home country as these characteristics can pose constraints on the shaping of foreign opportunities (Alvarez *et al.*, 2015; Vahlne and Johanson, 2017) by influencing the costs of “engaging in business activity of a given form in one nation as compared to another” (Henisz and Swaminathan, 2008, p. 537). Previous studies in IE indicate that the differences in how born global entrepreneurs respond to opportunities and threats in international markets are due to the cultural and institutional contexts in which the companies are embedded (e.g., Coviello 2015; Krammer *et al.*, 2018; Paul *et al.*, 2017). For example, extant research shows that firms with similar resources and skills internationalise at different speeds as a result of their varied contexts (e.g., Andersson *et al.*, 2014). This explanation opens the way for studies granting more relevance to the role of context (Paul *et al.*, 2017). Other authors assert that opportunity research should devote more attention to external factors and market processes, which can affect opportunity development by born globals (e.g., Alvarez and Barney, 2008). As Reynolds *et al.* (1999) observe, the most critical factor contributing to entrepreneurial
opportunities is a “set of social and cultural values along with the appropriate social, economic, and political institutions” (p. 43). Analysing international opportunity development processes in different institutional contexts, can, thus, represent a fruitful way to determine the influence of these institutions (Coviello et al., 2011; Jones et al., 2011; Karami et al., 2019).

Although the critical role of context in born globals’ internationalisation processes has been acknowledged (Andersson et al., 2013; Ryan et al., 2019; Whetten, 1989; Zahra and Wright, 2011), there is a lack of research on the influence of institutional factors on some aspects of born globals’ internationalisation processes (Knight and Liesch, 2016). More specifically, the understanding of how the institutional context influences the development of international opportunities has been rather fragmented, and studies on this topic are relatively limited (e.g., Jones et al., 2011; Shane, 2012). We respond to this research gap and position our study by addressing the following research question in the context of the home institutions of an emerging and a developed country:

**Research Question:** How does the home institutional context influence the international opportunity development process of born global firms?

To address the research question, we draw on concepts from opportunity literature and institutional theory. Following previous studies that have examined the internationalisation process through the entrepreneurial opportunity lens (e.g., Chandra et al., 2012; Chetty et al., 2018), we analyse the international opportunity development process of six born globals. Our analysis includes three case companies from an emerging economy (i.e., China), and three case companies from a developed country (i.e., Italy). Drawing on the institutional perspective, we examine how home country institutions influence the development of initial international opportunities of born global firms (Busenitz et al., 2000; Peng, 2003). We adopt qualitative research methods by conducting six in-depth case studies using a flexible pattern matching design (Bouncken et al., 2021; Sinkovics,
This approach to data analysis allows for further elaboration on the influence of different institutional contexts on international opportunity development by born globals.

Our study provides a key contribution to IE literature by considering the influence of an institutional context on the international opportunity development process by born globals as a critical question in IE research (Cavusgil and Knight, 2015; Chandra et al., 2012; Knight and Liesch, 2016; Zander et al., 2015). Analysing firms from two contrasting institutional contexts represents an appropriate framework to better understand the influence of institutional settings on born globals’ international opportunity development. As such, our study provides key empirical insights into how local institutional embeddedness can be a contributory factor in shaping the opportunity development process of born globals. This suggests giving more prominence to interactions between macro- and micro-elements by showing that flexible pattern matching can represent a suitable method to this purpose (Sinkovics, 2018).

The paper is organised as follows. We first establish the theoretical background with a detailed review of the literature to position the research question of the study. We then discuss the research methods and the context of the study. Next, we present the findings related to the study context and cross-case analysis. Finally, we conclude by discussing the theoretical contributions and the limitations of the study, and we outline some potential avenues for further research.

2. LITERATURE REVIEW

2.1 International opportunity development in the born global literature

Opportunity has become a central concept in IE research in that the internationalisation of firms is often explained in terms of international opportunity development (Chandra et al., 2012; Coviello et al., 2011). IE research has noted that opportunity opens a new and vast theoretical area for explaining the internationalisation of small firms and companies endowed with resource limitations (Zander et al., 2015). The opportunity literature distinguishes between certain types of opportunities, namely the creation versus discovery of opportunities. According to Alvarez and Barney (2007), some
opportunities are rooted in the external environment, independent from the entrepreneurs and waiting to be discovered by alert entrepreneurs. On the other hand, some opportunities are created by entrepreneurs who can imagine a better future. Some scholars consider both opportunities and discuss the duality of these opportunities and the way they enable one another (Chetty et al., 2018; Zahra, 2008). There are also other scholars who explain opportunities in the interface between these two major opportunities. For these scholars, opportunity has elements of both discovery and creation, in the sense that there should be some objective elements of opportunities through which entrepreneurs can further develop and create a new opportunity (Garud et al., 2014; Ramoglou and Tsang, 2017).

According to the opportunity-based view, there is generally no difference between born globals and traditional SMEs when examining the firms’ internationalisation process (Chandra et al., 2012; Johanson and Vahlne, 2009; Vahlne and Johanson, 2013). Rapid internationalisation tends to represent a truly rapid process only when ignoring the history of born globals’ first international opportunity development (Vahlne and Johanson, 2013; Chandra et al., 2012). This view explains born globals’ formation as a process of entrepreneurial opportunity development and exploitation (Evers and Andersson, 2021; Di Gregorio et al., 2008). Johanson and Vahlne (2009) note that the subsequent internationalisation of born globals is often fast, but, considering the history of the companies’ initial internationalisation, it is still a gradual process, which usually starts in psychically close markets and attributes high strategic importance to the founders’ existing relationships with international partners and previous international experience. Chandra et al. (2012) explain the firm’s rapid internationalisation by focusing on the importance of the history of rapid internationalisation and emphasising the dynamic entrepreneurial processes of international opportunity development by born globals. Indeed, studies on post-entry growth of born globals demonstrate that most of the firms reconfigure their international activities in the long run, complying with traditional internationalisation theories, whereas “true born globals” remain relatively scarce (Choquette et al., 2017; Vissak and Masso, 2015).
However, the opportunity research stream highlights the importance of explaining how the 
initial international opportunity is developed to better understand the subsequent internationalisation 
of the firm (e.g., Evers and O’Gorman, 2011). Particularly, in the case of born globals, the initial 
international opportunity development happens soon after its inception, during the most 
entrepreneurial phase, which tends to be less investigated compared to other phases (Ciravegna et al., 
2014). For instance, Ciravegna et al. (2014) find that the proactive search of the first client in 
international markets can be a predictor of the intensity and geographic scope, but not of the speed of 
firm internationalisation. The authors underline the importance of studying the first international 
opportunity development as it may contribute to determining the firm’s long-term international 
orientation, suggesting that internationalisation must be considered as “a strategically and actively 
pursued process” (Ciravegna et al., 2014, p. 1088). Thus, the development of international 
opportunity provides a common ground between the traditional internationalisation models (Johanson 
and Vahlne, 2009) and born global theories (e.g., Knight and Cavusgil, 2004). Approaching this issue 
also represents a fertile ground to develop a ‘collaborative’ approach on entrepreneurial 
internationalisation, in line with recent calls for studies at the crossroads between IB and IE (Verbeke 
and Ciravegna, 2018).

There is broad agreement on the centrality of opportunity development in the born global 
literature; however, our understanding of the mechanisms through which these firms develop their 
internationalisation opportunities remains rather incomplete (Zander et al., 2015) - and even more 
limited when we consider the influence of difference institutional factors on the entire process of born 
globals’ internationalisation (Domurath et al., 2020). A review of the born global literature shows 
that an important capability to create successful born globals is the ability of the founder to identify 
and acquire resources necessary to further develop and finally exploit market opportunities (Arthurs 
and Busenitz, 2006; Zander et al., 2015). Follow-up studies emphasise that international opportunity 
development processes may change according to the growth phase of born globals (Romanello and 
Chiarvesio, 2017; Chandra, 2017). Romanello and Chiarvesio (2017) find that entrepreneurs were
generally more proactive towards international opportunities during the entry stage, while they became more reactive, when they entered the post-entry stage. According to Chandra (2017), entrepreneurs tend to use simple rules to evaluate international opportunities during the early stage, but this aspect is influenced by time pressure, prior decision-making models, and the firm’s positioning. In contrast, during post-entry stages, entrepreneurs often benefit from their ability to revise international opportunities evaluation, thus achieving better results. Research also highlights that international and industry-marketing experience of born global founders often lead to the creation of international market knowledge, network building activities, and the development of opportunities (e.g., Andersson and Evers, 2015; Efrat and Asseraf, 2019; Freeman et al., 2010; Martin et al., 2020). In particular, the founders’ entrepreneurial capabilities may become fundamental to the creation of born globals (Karra et al., 2008) and to early internationalisation activities (Autio et al., 2000; Evers et al., 2012; Romanello and Chiarvesio, 2017). These capabilities can contribute to reducing the firms ‘liability of newness’ (Autio et al., 2000).

In addition, learning is an important mechanism of international opportunity development (Ryan et al., 2019). From the opportunity development perspective, learning often plays a critical role in the analysis of a firm’s internationalisation process (Blomstermo et al., 2004; Knight and Liesch, 2016) in that the development of international opportunities often entails connecting prior experience and knowledge, and observations of external conditions and events (Mathews and Zander, 2007). While the Uppsala model has focused more on experiential learning as the major form of learning (Johanson and Vahlne, 2009), born globals often experience different types of learning through their engagement with different opportunities. For example, Ciszewska-Mlinarič et al. (2020) develop a model of born global learning, which explains different types of learning, including searching, congenital learning, experiential learning, vicarious learning, and grafting. Learning can help small firms focus on long-term relationships and emerging opportunities (Sundqvist et al., 2012). Previous studies have emphasised the importance of learning in the process of international opportunity development, in terms of gaining the necessary information and developing cognitive
properties, obtaining access to financial capital and social ties, and risk perception and the propensity towards counterfactual thinking (Li, 2013).

Openness to learning is crucial for the innovativeness of born globals (Ciszewska-Mlinarič et al., 2020), which often plays a critical role in the successful internationalisation of born globals (Knight and Liesch, 2016). Mort et al. (2012) argue for innovative products as one of the key strategies for born globals’ successful internationalisation. Innovativeness is a key element that born globals emphasise also in relation to their internationalisation in different ways by looking at innovative ways to identify international opportunities, and by gaining access to complementary resources and leveraging them for further development of these opportunities (Knight and Liesch, 2016; Di Gregorio et al., 2008; Verbeke and Ciravegna, 2018; Zander et al., 2015).

Networking is another critically important mechanism in the international opportunity development process (Evers et al., 2012; Gerschewski et al. 2020; Vahlne and Johanson, 2013). According to effectuation theory and the Uppsala model, a firm’s internationalisation may not necessarily be an issue of ‘liability of foreignness’, but rather of ‘liability of outsidership’ from the relevant networks (Sarasvathy et al., 2014; Schweizer et al., 2009). According to this perspective, born globals’ internationalisation is perceived as the outcome of successful networking in which firms gain access to the complementary resources and learn from each other (Ciszewska-Mlinarič et al., 2020; Knight and Liesch, 2016; Ryan et al., 2019). This process leads companies to identifying new internationalisation opportunities and gaining access to necessary resources to further develop and exploit those opportunities (Sarasvathy et al., 2014; Vahlne and Johanson, 2017). For instance, Ciravegna et al. (2014) find that building supplier-seller relationships represents a reactive approach to internationalisation, while engaging in international activities through personal networks can be considered an actively pursued strategy. Thus, network insiders can perform better than outsiders in terms of successful foreign market entry (Almodóvar and Rugman, 2015; Gerschewski et al., 2020) and positive implications in terms of the speed at which firms can achieve insidership and internationalisation (Yamin and Kurt, 2018).
Institutional setting provides a broader context wherein all aforementioned factors and mechanisms work (Young et al., 2018). As such, the development of international opportunities by born globals takes place within the institutional context (Lundberg and Rehnfors, 2018; Romanello and Chiavesio, 2019). Young et al. (2018) emphasise the importance of institutional arrangements, showing that an institutional context which promotes stability leads to more imitative opportunities, whereas institutions enhancing flexibility are more likely to stimulate the creation of more innovative opportunities. In the next section, we further discuss the key role of institutions in born globals’ international opportunity development.

2.2 Institutional theory and international opportunity development

Institutional theory has traditionally been applied to explain the internationalisation of firms (e.g., Busenitz et al., 2000; Henisz and Swaminathan, 2008; Kotabe and Mudambi, 2003; Meyer et al., 2009; Peng et al., 2008). The importance of institutions in IE is critical due to the emphasis of IE on the investigation of transactions between counterparts across different countries, or inside one country in comparison to counterparts in another country (Henisz and Swaminathan, 2008; Jones et al., 2011).

Home-country institutions tend to influence entrepreneurship and new opportunity development due to the basic assumption that firms are embedded in country-specific institutional arrangements (North, 1990; Phillips and Tracey, 2007). Thus, the focus on institutions allows scholars to identify the cultural and other institutional forces, which influence entrepreneurial activities in a broader context (Zahra and Wright, 2011). Home-country institutional context can also impact the processes and motivations behind born globals’ internationalisation (O’Gorman and Evers, 2011; Zander et al., 2015). As such, the knowledge and understanding of the country’s institutional profile can help globally focused entrepreneurs to start-up firms that have international missions from the firms’ inception (Busenitz et al., 2000). Considering this key importance of institutions in international opportunity development, IE research has called for further research examining the
influence of the home country’s institutional context on different aspects of international opportunity
development process (e.g., Muralidharan and Pathak, 2017; Zander et al., 2015).

National institutional environments can contribute to explaining whether and how the nature
and behaviour of born globals differ depending on their country of origins. More interestingly, past
research has shown that companies from emerging economies can suffer liabilities of origin due to
the weak institutional infrastructures, the institutional process deficiencies, and the illegitimacy of
their home countries (Fiaschi et al., 2017; Khanna and Palepu, 2010). Reputation building generally
represents a common challenge for born globals, as these companies must often find a strategy to
overcome their liabilities of newness (Karra et al., 2008), but this aspect can represent a greater
challenge for companies located in developing countries. Indeed, even large multinational companies
from emerging countries may develop ad-hoc strategies to offset their liabilities of origin, for
example, through corporate social responsibility practices (Fiaschi et al., 2017; Nieri et al., 2019). At
the same time, local institutions can help mitigate this liability by stimulating internationalisation,
which is a natural incentive for emerging market companies to ‘do good’, in order to build their
reputation with foreign and local stakeholders (Nieri et al., 2019).

Some scholars have investigated how different stages of institutional transition in a single
country (i.e., China) influence entrepreneurial opportunities and attributes, and strategic choices for
firm internationalisation (e.g., Li, 2013; He and Karami, 2016). Focusing on China, Li (2013) finds
that during the early stages of institutional transition, opportunities and business transactions were
based on guanxi and other network relationships. In contrast, entrepreneurial capabilities and
resource-based strategies have become generally more important in the firms’ internationalisation
process at the late stage of institutional transition of the country. Li (2013) notes that different stages
of institutional transition inside the same country can lead to different dynamics and, consequently,
affect the firms’ internationalisation efforts. There has been an emphasis on the network-related
internationalisation strategies in emerging economies (Andersson et al., 2018; Kiss and Danis, 2008;
Peng and Heath, 1996), as relationships can reduce uncertainty and enhance the competitive
advantage of firms (Aidis et al., 2008; Li, 2013). In addition, it has been noted that entrepreneurs from emerging economies often do not possess relevant business and/or technical expertise, and, thus, may not be able to rely on prior business-related knowledge to discover opportunities (Kiss et al., 2012).

Differences across home-country institutions, especially between developed and emerging markets, can have different influences on similar processes (Busenitz et al., 2000). Emerging economies are characterised by low-income and rapid-growth and adopt economic liberalisation as the primary engine of growth (Hoskisson et al., 2000). Compared to developed economies, the institutional environment of emerging markets is often turbulent with rapid changes, and these economies generally possess relatively weak institutions to support market-oriented strategies (Aidis et al., 2008; Peng, 2003). Therefore, research findings from developed countries may not be simply generalisable to emerging markets (e.g., Eren-Erdogmus et al., 2010; Peng, 2000; Young et al., 2002).

The influence of the institutional context on born globals’ internationalisation motivations and processes also seems to vary in emerging and advanced countries (Zander et al., 2015). Whereas born globals located in European developed economies often benefit from some institutional advantages, born globals from emerging economies generally struggle with a set of institutional difficulties and challenges (Zander et al., 2015). However, even if this is what might be most expected, it should be noted that some studies comparing companies located in emerging and developed economies have identified other factors (e.g., networks), rather than home country institutional support, to be most influential on SME internationalisation (e.g., Andersson et al., 2018; Ciravegna et al., 2014). Some studies provide a more holistic picture and consider the influence of networks in a broader context of institutions (Chetty et al., 2006; Shirokova and McDougall-Covin, 2012). As discussed earlier, a firm’s networks have been recognised to be of strategic importance to born global firms for identifying international opportunities and foreign exchange partners, acquiring foreign market knowledge, reducing liabilities of newness and foreignness, and gaining access to other strategic resources (Amal and Filho, 2010; Bembons and Schwens, 2018; Gerschewski et al., 2020; Ryan et
al., 2019). However, home-based institutional agencies have been identified as facilitators in a firm’s internationalisation through their support and coordination mechanisms for early internationalising firms (Ahmed and Brennan, 2019; Bannò et al., 2014; O’Gorman and Evers, 2011).

Despite this, the capacity to favour institutional bridging, the preference for cross-cultural collaboration, and the capacity to understand the institutional difference between home and host country are generally drivers for success in the case of born globals (Karra et al., 2008).

### 2.3 Institutional Pillars

Previous IE research has developed a framework for comparative analysis based on the three dimensions of a country’s institutional profile (e.g., Busenitz, et al., 2000; Scott, 2014), which were found to be applicable to both developed and emerging economies (Manolova et al., 2008). According to Scott (2014), three institutional pillars generally influence entrepreneurship and firm internationalisation levels (e.g., Busenitz et al., 2000; Henisz and Swaminathan, 2008; Nasra and Dacin, 2010): (1) regulative, (2) cognitive, and (3) normative dimensions.

The regulative pillar primarily focuses on formal rule systems and enforcement mechanisms sanctioned by the state (North, 1990), and includes laws, regulations, and government policies aimed at supporting entrepreneurship and new businesses, reducing risks for start-ups, and facilitating the acquisition of resources by entrepreneurs (Busenitz et al., 2000). These norms help reduce the perceived risks related to starting international activities abroad and help deal with complex administrative processes (Sambharya and Musteen, 2014). Born globals are often sensitive to these aspects, as they generally suffer from the liabilities of smallness and newness (Autio et al., 2000; Di Gregorio et al., 2008). For example, Li (2013) observes that when regulative pressures were minimal, at the early stage of institutional transition, new ventures tend to initially build social connections to acquire more legitimacy. In contrast, at later stage of institutional transition, regulative pressures stem from formal market-supporting institutions motivated new firms to adopt market-oriented strategies.
This dimension has been found to be a predictor of opportunity-driven entrepreneurial activities (Sambharya and Musteen, 2014).

The second pillar, \textit{cognitive dimension}, refers to socially shared knowledge, taken-for-granted conventions, and values that are imposed on, or internalised by, social actors in relation to new businesses’ establishment (Busenitz \textit{et al.}, 2000; Scott, 2014). Cognitive institutions reflect how certain knowledge sets are institutionalised and become part of a shared social understanding (Zucker, 1991). The lack of knowledge is highlighted as one of the barriers of firm internationalisation, as foreign market knowledge tends to have a determinant role in internationalisation (e.g., Blomstermo \textit{et al.}, 2004) and the growth of born globals (Romanello and Chiavese, 2017).

The third pillar, \textit{normative dimension}, includes beliefs, norms, and assumptions about human behaviours of individuals in a country (Busenitz \textit{et al.}, 2000; Scott, 2014). This dimension determines whether entrepreneurial activities, creative and innovative thinking are admired and supported by society (Nguyen \textit{et al.}, 2009; Sambharya and Musteen, 2014). From the IE perspective, it expresses how entrepreneurs evaluate international activities and perceive them as a ‘normal’ aspect of their firms’ overall operations (Kiss and Danis, 2008). For example, while entrepreneurial behaviours, such as innovation and risk-taking, have been traditionally supported by institutions in the developed countries, institutional weaknesses in this dimension contributed to lower levels of entrepreneurship in emerging markets (Kiss \textit{et al.}, 2012). In emerging economies, the relatively lower economic tradition of these values in support of firm internationalisation, makes the desire for business expansion in international markets rather low (Kiss and Danis, 2008). Therefore, firm internationalisation is motivated by goals related to the general aspiration for obtaining a higher income and reaching a higher social status (García-Cabrera \textit{et al.}, 2016).
3. RESEARCH METHODOLOGY

3.1 The case study method

The purpose of this qualitative study is to examine the international opportunity development of six born globals from China and Italy and explore how the institutional context can influence this process. Consistent with previous studies (e.g., Chandra et al., 2012), we select opportunity as the unit of analysis. The main research objective is to examine the initial international opportunity development defined as the initial international sale, based on Ciravegna et al.’s (2014) operational definition.

We select a multiple case study approach as the key purpose of this exploratory study is theory building (Eisenhardt, 1989). In response to previous calls for qualitative studies of firms located in transition economies (e.g., Li, 2013; Jones et al., 2011; Romanello and Chiarvesio, 2019), we adopt a flexible pattern matching design (King, 2014; Bouncken et al., 2021; Sinkovics, 2018) to conduct a multi-level qualitative analysis on how institutions at macro-level can influence the international opportunity development process of born globals. Pattern matching represents “an attempt to link a predicted pattern that is derived from theory with an observed pattern” (Sinkovics, 2018, p. 5). We adopt the flexible, rather than the full pattern matching, as it is more aligned with theory building objectives (Sinkovics, 2018; Sinkovics et al., 2019). This method is considered appropriate, as it merges a deductive approach, while allowing the inductive emergence of new elements and “the identification of patterns from the data” (Sinkovics et al., 2019, p. 139).

3.2 Case selection and data collection

To ensure that samples and sites chosen for the analysis are consistent enough to be compared (Jones et al., 2011), we adopt a relatively strict operational definition of born globals, following Coviello’s (2015) suggestions. Thus, the sample firms fulfill the following four characteristics: (1) company age less than 20 years (to reduce recollection bias); (2) initial foreign market entry within three years after company establishment with an export share of at least 25% (Knight and Cavusgil, 2004); (3) still
include the companies’ founders to collect primary data (and to reduce recollection bias); (4) possess
a global orientation (i.e., a ‘scope’ dimension), in terms of having entered at least one country outside
their home continent (e.g., Andersson et al., 2013; Gabrielsson and Gabrielsson, 2011).

We use the Register of Companies to identify a pool of potential sample firms in Italy, while
we access Chinese firms through the researcher’s personal networks and guanxi, using a
‘snowballing’ method. When research problems are related to complex phenomena, a small number
of case studies is generally preferred (Eisenhardt, 1989). After developing the sixth case study, data
collection was concluded, as the marginal improvements obtained with the addition of the last two
cases had been minor. Ceteris paribus, a theoretical saturation point was reached, and results emerged
relatively clearly (Eisenhardt, 1989).

We collected empirical data by means of semi-structured, face-to-face, in-depth interviews
conducted with the founders (i.e., entrepreneurs) of the case companies, and supplemented this with
archival data (e.g., company records). Interviews were audio-recorded and transcribed accordingly.
The interview questions related to the born globals’ establishment, product type, founders’
backgrounds, internationalisation process, and the initial international opportunity development
process. We followed-up with the interviewees by email and phone to clarify the key points of the
interviews. In addition, we used secondary data, including press and archival data, for data
triangulation purposes at a later stage of the data analysis.

Table 1 shows the basic information of the sample firms included in the study.

***Table 1 about here***

3.3 Data analysis

We developed the interview coding template based on the analysis of previous literature and other
indicators provided in recent reports about the institutional profiles of China, an emerging economy,
and Italy, a developed country. The country selection reflects the rationale to represent two different
institutional environments, in terms of socio-cultural evolutions, historical backgrounds, and policies
towards born globals and entrepreneurship. The institutional profiles of the two countries were examined, mainly based on the commonly used operationalisation of Busenitz et al. (2000), as summarised in Table A (in Appendix on pp. 44-45 of the paper). Thus, we created an initial template, including the institutional profiles descriptions of the two countries and the expected patterns related to institutions and other factors influencing the international opportunity development process. Based on the analysis of the institutional profiles, the initial template helped the emergence of patterns by confronting the expected and the observed patterns (Sinkovics, 2018; Sinkovics et al., 2019). The initial preliminary template was then supplemented and enriched with observed patterns, as illustrated in the findings section below.

The cross-case analysis involved multiple investigators as this enhances the creative potential of the research (Eisenhardt, 1989). Each investigator assumed a unique role: the first investigator interviewed the Chinese entrepreneurs, the second investigator interviewed the Italian entrepreneurs, whereas the other investigators were excluded from primary data collection and assumed the role of ‘resident devil’s advocate’ (Eisenhardt, 1989; Sutton and Callaham, 1987). After carefully reading the interviews’ transcripts and discussing the cases, the investigators examined in-depth the international opportunity development process of each firm and created comparative Microsoft Excel tables. This technique allowed each investigator to bring different perspectives to the discussion, thus allowing for an integrated analysis of the available empirical data. In addition, when observations of multiple investigators converge, the level of confidence in findings generally increases (Eisenhardt, 1989).

4. FINDINGS

The findings are organised into two main aspects. After briefly presenting the study context, we first present the findings related to the cross-case comparison in relation to the international opportunity development process enacted by Chinese and Italian born globals. Second, we demonstrate how institutions influence this process differently in the two institutional contexts.
4.1 Study context: Institutional profiles of China and Italy

The two countries present different institutional contexts in relation to IB and entrepreneurship (as described in detail in Appendix A on pp. 44-45 of the paper). In China, the government generally encourages entrepreneurship and explicitly supports firm internationalisation (Boisot and Meyer, 2008; Child and Rodrigues, 2005), while the home environment tends to be relatively unstable and less protected when it comes to doing business (Acs et al., 2017). In addition, the socially shared knowledge about doing business is limited, and entrepreneurship is often valued less than education. To sum up, in China, we find a strong regulative pillar in relation to internationalisation (e.g., ‘Go Global Policy’), but weak cognitive and normative pillars in relation to entrepreneurship and new business establishment.

In contrast, Italian institutions provide a relatively predictable context for business, but often do not specifically encourage (through policies) firms’ international activities (Acs et al., 2017). In addition, according to Young et al. (2018), Italy provides a rather unstable, but highly flexible context in which to develop opportunities. Although entrepreneurship tend to be generally admired by the Italian population, failure and risk perceptions are negatively perceived. This aspect makes access to finance more difficult in Italy for small and young firms without a strong reputation. Compared with China, there are no specific funding policies for firms’ internationalisation, even though Italian companies can eventually look for the support of institutional organisations (e.g., Chambers of Commerce). Therefore, Italy presents a weaker regulative pillar in relation to international business and stronger cognitive and normative pillars in relation to entrepreneurship culture and new business practices. None of the two countries seem to have institutions that clearly facilitate foreign market knowledge acquisition.

Appendix A summarises the template used to analyse the institutional profiles of China and Italy. Based on previous frameworks (Kostova, 1997; Scott, 2014; Busenitz et al., 2000), we draw on the literature and report on institutions in China and Italy to advance the institutional profiles of the
two countries in relation to born globals, entrepreneurship and internationalisation (e.g., Peng and Heath, 1996; Aidis, 2005; Kiss and Danis, 2008; Li, 2013; Stenholm et al., 2013).

4.2 International opportunity development process of Chinese and Italian born globals

Our case findings provide evidence that Chinese and Italian born globals leveraged different types of knowledge to develop international opportunities. Chinese and Italian born globals’ entrepreneurial capabilities were also influenced by the institutional contexts in which they were located and embedded. Chinese born globals mainly relied on the founders’ international knowledge and networks, whereas Italian born globals exploited the founders’ technical and industry knowledge.

Chinese founders had prior experience working and living overseas, which translated into a key source of foreign market knowledge and networks. For example, the founder of C1 worked and lived overseas for a long time prior to establishing a firm in China, while the founders of C2 and C3 worked for foreign companies in China. Through prior work experience, the founders obtained some knowledge about international business in general and about some specific foreign markets. They also had a general aspiration about internationalisation as they wanted to benefit from the ‘Go Global Policy’, but had no clear ideas of where to settle international activities. C1 provides an illustrative example. The entrepreneur possessed marketing knowledge of the US market because of his prior 10 years of experience in the United States. However, after returning to China to establish his own business, he had no clear idea about which products to develop or how to establish a business. By interacting with a former American partner, the founder decided to target the United States as the first international market and to decide which products to manufacture. This case clearly shows that the discovered international opportunity was the result of an active network in the target market, which helped develop a suitable product for that foreign market.

Embedded in a context where the regulative pillar was strong and provided strong incentives for internationalisation, the Chinese founders often leveraged the Chinese government’s ‘Go Global Policy’ to find an opportunity to internationalise their businesses. The founders had a general
aspiration for internationalisation as they were aware of existing incentives. However, as they were in a context where cognitive and normative pillars were weaker, they generally had no clear idea of which products to manufacture, nor did they have entrepreneurial business and start-up knowledge. To compensate for these institutional weaknesses, they leveraged their networks to understand which products to create, how to establish their businesses and how to start international activities by discovering international opportunities within their networks.

Born global founders in the Chinese context relied on social and business networks that stemmed from the founders’ prior working and international experiences to develop the first cross-border opportunities (see Table 2). For Chinese born globals, developing networks tended to be more akin to a strategy. As the founder of C1 noted, “Having network is in a company’s culture, knowing people is a kind of strategy. It will make the opportunity happen occasionally or planned”. The founders of C1 and C3 contacted a former partner and a previous international client. The first opportunity for C2 was rather serendipitous: a founder’s social tie, who was a decision maker in a Chinese MNE, requested to join C2 for an overseas project.

***Table 2 about here***

Compared with Chinese born globals, Italian born globals were generally more product oriented. Often, Italian entrepreneurs initially focused on creating products with distinctive features. This can be explained by the fact of Italy having a long tradition of manufacturing with a history of leading global companies in the design industries. In addition, with a long cultural orientation towards beauty and aesthetics since the Renaissance, Italian entrepreneurship generally has a strong orientation towards the creation of products that show outstanding properties and design. Being influenced by these cultural and cognitive institutions, the founders were then able to recognise the global market potential embedded in their products. As a result of prior work experience, the Italian born global case founders possessed strong industry and product-specific knowledge. They also had strong knowledge of and access to overseas distribution channels. In addition, they had a general
awareness of how to establish a new business. In contrast, as they had no considerable prior
ternational experience, they lacked access to reliable knowledge of overseas markets and had no
active network(s) to facilitate internationalisation. This resulted in Italian born global founders
adopting a different approach to international opportunity development. For example, because of their
prior work experience as dealers of similar products (I1, I2) and employees in the same sector (I3),
Italian founders identified international trade shows as the best option to discover international
opportunities. Trade shows were considered optimum international marketplaces where supply and
demand meet. As one of the founders of I3 noted:

“During our previous jobs, we learned about the most important trade show of machinery
manufacturing. It is once a year, in Germany. We knew that it was very expensive for a start-
up, but we also knew it was the best option to meet our potential demand. And our marketplace
is the world, not the domestic market.”

Due to their industry knowledge Italian founders could identify the most promising
international industry-specific trade fairs to promote the companies’ products and find potential
international dealers and partners who were conscious of their products’ quality. As a result of
attending global trade shows, they developed follow-up contacts with international partners directly
in overseas markets or, alternatively, invited them to their factories in Italy. For example, the founders
of I1 and I2, respectively, reached Australian and Israeli distributors in their countries to sign
contractual agreements. Follow-up meetings served the purposes of verifying the reputation of the
foreign distributors (I2), better illustrating the products’ specificities and post-sales services (I2, I3)
and signing final distribution agreements (I1, I2, I3).

In Italy, the regulative pillar in relation to internationalisation was relatively weaker, so Italian
entrepreneurs could not benefit from incentives and other institutional support. This aspect pushed
them to leverage their pre-existing knowledge to identify the best options where they could maximise
their efforts in looking for international clients: international trade shows. In contrast, the Italian
context presents stronger cognitive and normative pillars as entrepreneurship and start-up knowledge
are diffused. As a result, the Italian entrepreneurs benefited from diffused knowledge regarding how
to do business and how to engage in entrepreneurial activities in Italy, freeing up mental and physical resources to create products with global potential, hence allowing them to focus on internationalisation.

4.3 The role of institutions in the international opportunity development process

4.3.1. Chinese born globals

The international opportunity development process was influenced by the way founders perceived the institutional contexts, leading to different approaches for reducing the associated risks. In terms of regulative institutions, Chinese entrepreneurs perceived the strong support offered by governmental policies as encouraging local companies to go global. Chinese born globals highly benefited from the so-called ‘Go Global Policy’ initiatives by the Chinese government. In addition, settling international activities represented an opportunity for risk diversification as an alternative to doing business in China, which was perceived as an unstable context to start a new business.

Second, Chinese born globals tended to rely heavily on networking in their process of discovering initial international opportunities. This reliance on networking had different aspects. First, regarding cognitive institutions, China is characterised by a general lack of knowledge on doing business and dealing with the risks of internationalisation and a weak information system. Influenced by guanxi practise, Chinese born global founders leveraged valuable network ties related to past work experiences abroad to overcome legitimacy problems, exploiting and leveraging the trust and reputation with their network ties. The Chinese born global founders benefited from their personal foreign market knowledge obtained during their prior international experience and leveraged the knowledge of their network ties to discover international opportunities. Moreover, all Chinese entrepreneurs had internationalisation as a general aspiration that was both influenced by incentives and their experiences abroad.

Trust building plays an important role in the Chinese context. The trust built in social networks during prior experiences became an essential intangible asset to reduce the risks related to the firms’
initial international entry into overseas markets and to cope with the potential risks of early business failure. Social networks and ties were used to compensate for the lack of supportive institutions. For example, the founder of C3 noted:

“If I face the choice of two companies with same qualified, I will definitely work with the one who is my friend. It will bring advantages in the future cooperation. If some problems happen, we can negotiate and communicate easier. It is hard to do business without social networks involved, especially in the overseas markets.”

Third, in terms of normative institutions, the Chinese context generally lacks social norms that can motivate entrepreneurial activities, while traditional culture often appreciates the role of education and bureaucracy. The perception of the risk of failing with an early business is widely disregarded by Chinese normative institutions. As Chinese society is highly network oriented, it was relatively natural for the Chinese born global entrepreneurs to leverage their social networks both to overcome challenges and discover international opportunities. The born global founders used social networks with the Chinese government to get support and obtain easy access to various policy benefits. For example, C2 benefited from a preferential policy for both the company (e.g., low rental costs, tax incentives) and the founder (e.g., residential allowance). For instance, the founder of C2 noted the following:

“I worked in a Singaporean company in 2002, so I am familiar with this foreign market. [After I left the company], I visited Singapore with some bosses and technology experts [of Chinese large companies]. Then we became familiar with each other. When they [or one of them] had a project, they [or he] just called me to ask whether I can do it. I say ‘Fine, no problem’, ‘We can work together’. Then, we started to work together. Many projects happen like this.”

4.3.2. Italian born globals
The Italian context is quite different from that of China. In terms of regulative institutions, the Italian government does not offer specific policies for young and small companies planning to internationalise. Italian born global founders were aware of the existence of some institutions organising international trade missions (e.g., Italian Chamber of Commerce) and offering services
abroad (e.g., Italian Embassy), but they perceived them as relatively expensive and ineffective. For example, the founder of I1 noted:

“There are no funds supporting young firm internationalisation. I am aware of the services offered by embassies, but they are expensive and provide useless generic information on the foreign market. Our product requires a lot of certifications, which change depending on the national healthcare system. We had to build specific foreign market knowledge by our own.”

In addition, the relatively clear procedures in the home country facilitated the creation of the new ventures, so Italian born global entrepreneurs could focus on establishing riskier internationalisation activities from the beginning. Because there was no available specific regulative support for the internationalisation of firms, the Italian born global founders leveraged their industry knowledge to identify global trade fairs and develop international opportunities.

In terms of cognitive institutions, seeing its long tradition of entrepreneurship, there is general knowledge on how to establish and manage new businesses in Italy. The Italian born global founders created ventures in a relatively short time and without encountering many bureaucratic complications, even though creating their firms was an expensive process. In a context where manufacturing companies tend to pursue qualitative upgrading, Italian born global founders (I1, I2, I3) leveraged their product- and industry-specific knowledge to create products with distinctive features, embedding a global potential. Due to past industry experiences, the Italian founders chose to participate in trade shows as a means to discover international opportunities and gain a foothold in foreign markets through international partners and clients.

Regarding normative institutions, in a society that encourages innovation, value creation, and entrepreneurship but strongly criticises failure, Italian born global entrepreneurs tended to first focus on the creation of new and innovative products and then decided to test the interest of clients in international contexts for their products. This reflects a strategy to minimise costs while maximising the exposure of products to potential foreign partners and clients. As accessing capital from banks is generally difficult for Italian SMEs and start-ups, Italian born global founders invested their own personal savings to start the firms’ international activities. This contributes to explaining why they
used their industry knowledge to identify a few select international trade shows with the intention of optimising the chances of discovering international opportunities.

4.3.3 Summarising the results from pattern matching analysis

The pattern matching analysis confirmed the importance of some relevant factors as they influenced the development of international opportunities both by the Chinese and Italian born globals: the prior working experience of the founders in similar sectors, the sector knowledge, the learning, the prior international experience of the founders (strong in China, weak in Italy), and the global mindset (stronger in Italy than in China), as illustrated in Table 3. Moreover, our analysis showed that some factors influenced the process only in the Chinese context, such as foreign market knowledge, foreign language knowledge, and networking capabilities, whereas other factors were only influential in the Italian context, such as the strong technical/product knowledge of the Italian founders. More interestingly, our analysis highlighted some new elements that contributed to shaping this process. For example, the Chinese founders were returnee entrepreneurs, an aspect not really considered by the literature, whereas Italian founders showed excellent product-driven capabilities rooted in the Italian culture of design and manufacturing. Although returnee entrepreneurship is not a new topic in China (e.g., Kenney et al., 2013), our analysis showed how the institutional setting supporting internationalisation becomes an additional element that can influence its impact on international opportunity development. These new elements, which inductively emerged from the analysis, constitute relevant factors that could be investigated in future research.

Table 3 illustrates the results of the pattern matching analysis in relation to the institutions and factors influencing the international opportunity development process of the six born globals.

***Table 3 about here***
The different relevance and intensity of the factors influencing the international opportunity development process of the born globals can be better interpreted by examining the role of the institutional contexts in which those companies are embedded. More specifically, the cross-case comparison highlighted that the Chinese and Italian founders developed international opportunities in different ways because of their institutional settings, as illustrated in Figure 1.

***Figure 1 about here***

The international opportunity development process was primarily network oriented for Chinese born globals, whereas it was mainly product driven in the context of Italian born globals. In the Chinese cases, the born global founders discovered opportunities by exploiting social networks gained during their prior work and international experiences. Thus, the Chinese founders demonstrated strong capabilities in using networks to serve the purpose of international opportunity development. Rather than focusing on the product, they mainly focused on settling a business abroad, and leveraging their previous network ties. As the domestic market was perceived as high risk, they leveraged the ‘Go Global Policy’ and their network to develop an opportunity in the markets that were already known by the entrepreneurs. In this sense, they developed opportunities that tended to be more imitative.

In contrast, Italian born global founders generally focused more on product development and exploited their product- and industry-specific knowledge to develop outstanding products. As these founders had no foreign market knowledge or an explicitly supporting institutional environment, they used relevant trade fairs to develop international opportunities by looking for new partners and dealers in foreign countries. In this sense, Italy was perceived as a stable and flexible context in which to create a new venture, but rather unstable as a domestic market. These aspects led the entrepreneurs to creatively develop opportunities by promoting their products abroad instead of targeting a specific market. Interestingly, the Chinese founders already had a general aspiration towards firm
internationalisation prior to creating the products because of their knowledge of the ‘Go Global Policy’. In contrast, the Italian born global founders decided to internationalise only after they had created the final products and recognised the global market potential of the products later in the process.

In summary, our findings show that the influencing factors and international opportunity development processes are influenced by the institutional contexts where the companies are located, underlining the importance of considering the context in future analyses (Paul et al., 2017). In addition, our findings contribute to enriching the open debate on the influence of the institutional context on the international opportunity types and development process (Young et al., 2018; Romanello and Chiarvesio, 2019).

5. DISCUSSION AND CONCLUSION

The current study contributes to enhancing the emerging research stream on the initial international opportunity development process that attempts to kickstart born globals into internationalisation, providing empirical evidence of the factors impacting this process and emphasising the critical influence of institutions. In China, the born global founders appreciated the existence of government policies supporting firm internationalisation. In addition, the Chinese born global entrepreneurs leveraged their social networks to access policy supporting internationalisation. During the international opportunity development process, the Chinese born global founders leveraged their foreign market knowledge and social networks related to their past international experiences abroad to overcome institutional weaknesses related to the cognitive and normative dimensions.

Compared with China, the Italian founders could not benefit from specific support for firm internationalisation due to a weak regulative dimension in Italy. However, in a context where product innovation is favoured (Acs et al., 2017; Fondazione Masi, 2013), a product-oriented logic characterised the international opportunity development process of the Italian born globals. As the regulative dimension related to internationalisation is weaker and the cognitive and normative
dimensions related to entrepreneurship are stronger, the Italian born global founders leveraged their strong technical and industry knowledge to create products with global market potential and their product-specific capabilities to identify international trade shows to discover international opportunities. From the pattern matching analysis, these two elements emerged as new. The findings from this paper support previous studies (Gerschewski et al., 2020; Ryan et al., 2019; Evers and Knight, 2008), showing that trade fairs were used as ‘nodes’ to maximise the chances of international opportunity development, while minimising the risks and investments of international business.

This study responds to recent calls in the literature in terms of the importance and relevance of context in IB studies (Paul et al., 2017; Reuber et al., 2017) and IE research (e.g., Krammer et al., 2018; Zahra and Wright, 2011). Our study contributes to IE theory by explaining how the home institutional context influences the international opportunity development process of born globals. Moreover, we contribute to IE theory by showing why companies located in different countries adopt different approaches to discover international opportunities. Our findings offer new insights into the debate on the importance of international opportunity development in the IE and IB literature (Verbeke and Ciravegna, 2018) by highlighting how the home institutional context can influence born globals’ international opportunity development by leveraging different knowledge types derived from their backgrounds and different capabilities and by developing different approaches (e.g., Peng et al., 2008). In line with recent calls in the literature (e.g., Chetty et al., 2018; Zander et al., 2015), our study supports the idea that born globals are not necessarily purely characterised by asset parsimony. We find empirical evidence that born globals’ capacity to develop international opportunities primarily derives from a recombination of the available resources (Knight and Liesch, 2016; Verbeke and Ciravegna, 2018), which is strongly influenced by the institutional context where the firms and individuals are embedded.

The analysis of the international opportunity development process of born globals is contextualised in two different home country institutions: China, an emerging economy, and Italy, a developed country. Our study indicates that the international opportunity development process of
born globals is better understood when analysed in relation to the specific home country institutional context, as regulative, cognitive and normative institutions tend to strongly influence this process. The incorporation of different home countries represents a suitable framework for evaluating the impact of institutions on the international opportunity development process of born globals.

Our study highlights the fundamental role of the institutional context, as it contributes to shaping the opportunity development process of born globals, suggesting more prominence should be given to the interactions between macro-elements (e.g., institutions) and those aspects at the micro-level (e.g., entrepreneurial characteristics and capabilities). In addition, our study provides support for the suitability of a flexible pattern matching design for this purpose, as indicated in previous studies (e.g., Sinkovics et al., 2019).

In addition, our study contributes to enriching the relatively scarce research regarding the institutional perspective, which represents a commonly used framework in the emerging market literature, but that tends to be less applied in developed economies. The cross-case analysis indicated how both weak and strong institutions influence the process of international opportunity development. The founders leveraged different types of knowledge and capabilities to identify international opportunities in response to the characteristics of home country institutions. Influenced by home country institutions, the Chinese born globals mainly relied on the founders’ international knowledge and networking capabilities while benefiting from a strong regulative pillar in relation to internationalisation incentives. However, in a context where cognitive and normative pillars in relation to entrepreneurship are weaker, they leveraged their networks to identify which product to create and export to overcome the challenges - due to their country of origin - related to understanding how to create a new business in China. This also shows how the international opportunity process was articulated to overcome the liabilities of origin in terms of institutional lacks, as noted in recent studies (e.g., Fiaschi et al., 2017; Nieri et al., 2019).

In conclusion, the Chinese born globals generally transformed the entrepreneurs’ general inspiration for internationalisation to successful internationalisation through their networking with
different stakeholders in the home and host countries. In contrast, the Italian born globals tended to exploit industry-specific knowledge and product-specific capabilities to develop international opportunities without relying much on regulative support for internationalisation, hereby benefiting from strong cognitive and normative pillars that helped with starting an entrepreneurial activity in Italy. The fact that the Chinese born globals discovered international opportunities mainly through social networking seems to be an intriguing result, considering that some research has found that networks were not positively associated with the superior international performance of Chinese SMEs (Ciravegna et al., 2014). In the case of Italy, a strong product orientation often characterised the international opportunity development process. The product and industry-specific knowledge represented the basis for discovering international opportunities, thus laying the foundations for successful early internationalisation (Romanello and Chiarvesio, 2017).

6. LIMITATIONS AND FUTURE RESEARCH

By providing empirical evidence in terms of the influence of home country institutions and the international opportunity development process of born globals, the current study bridges two phenomena of interest for policymakers: born globals and the institutional context (Eurofound, 2012; Mandl and Patrini, 2018). The studied companies represent a particular type of firm where the start-up stage co-exists with aggressive expansion in the global marketplace.

Our study highlights the challenges related to both conditions and how home country institutions can contribute to offering a stable context in which to start international business activities. Policymakers can draw from these findings to better plan future policies by considering the existing perceptions of institutions and entrepreneurs. For instance, the results of our study highlight the positive impacts of the ‘Go Global Policy’ that is available in China, which stimulated the need for firm internationalisation among Chinese born global founders. In contrast, the absence of favourable policies for firm internationalisation in Italy forced the founders to focus on the development of international opportunities through strategic events and trade shows. From a
practitioner’s perspective, the analysis of Italian and Chinese institutional profiles in relation to international opportunity development highlights the challenges and best practices that can be encountered and used in these two countries.

The findings of the current study reflect the exploratory nature of the paper. The relatively small number of cases included represents a limitation of the study. However, it should be noted that the key purpose of this research was the exploration of relationships related to specific phenomena rather than generalisability as the goal of this paper was primarily theory building (Eisenhardt, 1989). Our study considers the overall influence of institutions as the key context. Future research could use quantitative methodologies to test the relationships that emerged from this study and examine the alternative roles of institutions in the process of born globals’ internationalisation. For example, future research may investigate the moderating and/or mediating role of institutions in the international opportunity development process, both in the case of born globals and SMEs. In addition, future research would likely benefit from studies testing these relationships in broader and bigger samples, in different institutional contexts, and by considering different types of ventures and industries/sectors (e.g., service).

Following recent research on the antecedents of maturing born globals, future studies may benefit from analysing the potential relationships between international opportunity development and other determinants, such as international trade shows (e.g., Gerschewski et al., 2020; Khan and Lew, 2018; Ciravegna et al., 2018; Hagen and Zucchella, 2014). For example, future research could focus on variables, such as entrepreneurial orientation (EO) and learning orientation (LO), which can serve as mediators in the international opportunity development process of born globals (Gerschewski et al., 2018; Hagen et al., 2012).

<td>The founder had a 20-year working experience in the orthopaedic industry. Thanks to this experience, he was able to identify the key international trade fair where to first promote and market his products. He had no prior relevant international experiences.</td>
<td>The founder identified and attended the most important trade fair of the orthopaedic industry. There, he obtained valuable feedback from the market and met a potential distributor from Australia. Then, he invited and hosted the distributor in Italy, where he offered training courses about product features. Then, he exploited the dealer’s foreign market knowledge (e.g., certifications...) to start selling in Australia. This way he compensated for his lack of international knowledge.</td>
<td>In a context where internationalization incentives are lacking and other services provided by institutions were considered expensive and useless (weak regulative pillar), the founders leveraged their prior sector knowledge to identify the best opportunities to promote products abroad and find potential international clients. However, as they were immersed in a context where entrepreneurship is part of national culture and traditions (strong cognitive pillar), they benefited from a diffused and shared knowledge of how to do business and entrepreneurial activities in Italy.</td>
</tr>
<tr>
<td>I2</td>
<td>The founder had a 20-year experience as a dealer of a well-known German company in the same sector, but with a different price positioning. The founder lived in Germany for some time when he was young but had no other international experiences.</td>
<td>Thanks to his sector knowledge, the founder recognized the global potential of its innovative product and decided to participate in several trade fairs in the Netherlands, Israel, France, and Germany. He particularly selected a luxury trade fair, where he met a potential distributor for the Israeli market. After that, follow-up meetings were conducted in the United Arab Emirates (UAE) and Israel to sign agreements for an exclusive distribution strategy in Israel.</td>
<td></td>
</tr>
<tr>
<td>I3</td>
<td>The two founders had strong technical knowledge obtained through previous jobs respectively as technician and software mechanic. They had no international experiences, nor foreign languages knowledge.</td>
<td>Thanks to their strong technical knowledge, the founders decided to attend and identified an important international trade fair in Germany for producers and buyers of food machinery and promote their plants. They promoted their plants there and were able to convince a potential client to buy the first plant from them, leveraging their wide technical experience gained through 20 years of technical jobs.</td>

<tbody>
<tr>
<td><strong>Regulative</strong></td>
<td>China offers support for entrepreneurs to leverage resources for internationalization (‘Go Global Policy’), but often offers no protection to start new and small business (e.g., lack of law protection). The government implemented a positive policy which encourages establishing high-knowledge and technology companies that can compete on global market. These policies include a preferential policy for the company (e.g., low cost of rent, tax preference, etc.) and for the founder (e.g., residential allowance) – e.g. set a development zone to support the development by reduction of the administration costs. According to the World Bank Annual Ranking, the ease of starting a business is ranked 85.47 out of 100. At the same time, there is a low level of protection of new business, which are embedded in a complex bureaucracy. The legal and judicial systems are still developing, characterised by relatively poor enforcement of commercial laws, non-transparent judicial systems, unpredictable regulatory changes and extremely discretionary explanation or enforcement of ambiguous laws and rules.</td>
<td>Italy presents a relatively clear and stable context where to create new business (rank 3.53). Government organizations provide information, assistance, and regulated contracts. Laws and bureaucratic guidelines are well known inside the country, even if starting a new business tends to be expensive. Starting a business is ranked 89.42 out of 100, entailing costs for 13.7% of per capita income. Italian companies tend to remain small over the long run for several reasons. For instance, bureaucracy, high administrative expenses, a complex regulative system, and time-consuming rate of delivering justice represent barriers to entrepreneurial activities. Access to finance represents a serious issue for entrepreneurs, pushing them to personally guarantee. This indicates that both the risks of creating a new business and internationalization may fall back onto the individuals and their families. There are some institutions providing support for internationalization missions (e.g., Chambers of Commerce, Italian Trade Agency), but no explicit IB policies.</td>
</tr>
<tr>
<td><strong>Cognitive</strong></td>
<td>Knowledge of how to establish and operating new businesses is not widespread in China. Due to the institutional transition from planned economy to a more market-oriented system in China, individuals often do not have a clear idea on how to do business and may lack knowledge on how to deal with risks. The relatively weak information system in China often blocks the individuals to formally obtain market information and access foreign market knowledge. Moreover, the Chinese population tends to show a high propensity to start new businesses when they migrate to new countries.</td>
<td>Busenitz et al. (2000) rank Italy with a score of 3.76 on the cognitive dimensions. Individuals generally know how to protect their businesses, whereas managing and dealing with risks is generally less known, especially in relation to firm internationalization. In this sense, it is not easy to obtain specific information about international markets, customers, and potential partners abroad. Governmental institutions overseas (e.g., embassies, Chambers of Commerce) can help in the process, but it is a paid service. The 92.5% of industrial companies have less than 20 employees. The majority of firms in Italy are SMEs and family-owned businesses. However, Italy is considered less individualistic as society and has a tradition of clusters and districts, which still exist.</td>

<tr>
<th>Institutions</th>
<th>China</th>
<th>Italy</th>
</tr>
</thead>
<tbody>
<tr>
<td>Normative</td>
<td>The undeveloped market-based economy and weak institutions generally limit individuals in creating new ideas, and innovative and creative thinking. A similar effect is due to the weak information system. The market system, such as the credibility of the financial system, does not support entrepreneurs well in China. In addition, Chinese people generally admire a high level of education more than entrepreneurship. Society is generally highly network-oriented. The common practice of guanxi is widespread across the country, and favours the relationship building and the networking activity.</td>
<td>Normative dimension is ranked 4.74 out of 5, as Italian people traditionally highly admire entrepreneurship. The country has a relatively long tradition of entrepreneurship, trade and finance, which has generally brought positive perceptions of productivity and industrialization. In addition, Italy shows a relatively low score in terms of human capital, which means that the quality of entrepreneurs in terms of level of education is not very high. According to the Global Entrepreneurship Monitor 2018, potential entrepreneurs have low levels of self-assessments and high fears of failure. The entrepreneur status is generally perceived negatively by people, where failure is proposed as a blot, not as a possible step in a high-risk process.</td>
