Do 8-minute Meditations Help You Stay Alert?

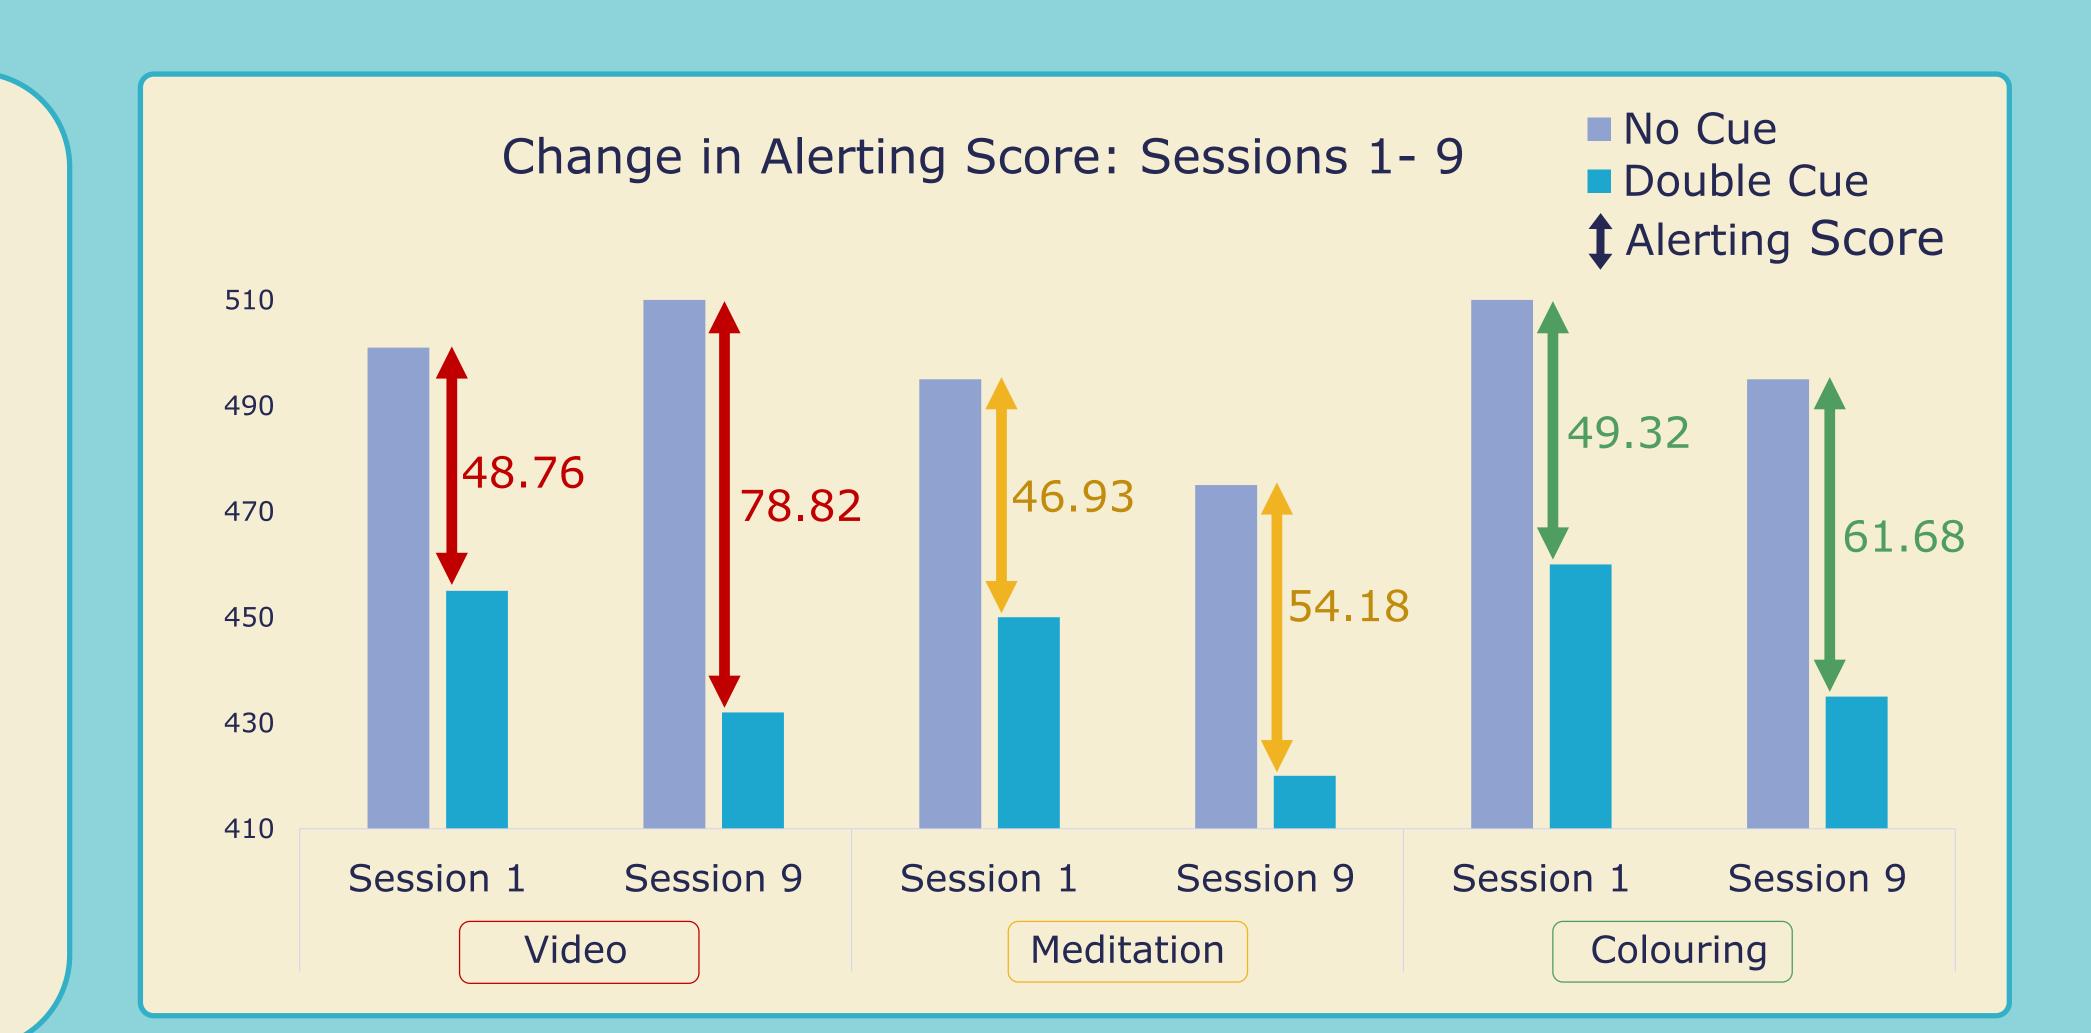

The Effects of Longitudinal Short Meditation Interventions on the Cognitive Alerting Network.

Zaffie Cox & Dinkar Sharma

1. Introduction

- Mindfulness meditation: Training to increase non-judgmental awareness in the present moment.
 - Believed to work by training cognitive processes such as the attentional networks
 - Relatively little research on the cognitive effects of mindfulness
 - Understanding these effects could lead to more targeted uses
- The alerting network: the individual's readiness for a stimulus to appear
 - Differences have been found in long-term meditators but not in short-term interventions (Tang, Hölzel, & Posner, 2015).

2. Method

- 57 meditation-novices.
- Three different 8-minute interventions:
 - Meditation, Colouring (active control) and a nature Video (control)
- Mindfulness measured using MAAS State
- Alerting was measured using the
 - Attention Network Test (ANT₁)
 - A modified flanker taskFour cueing conditions
- An ANT with alternative stimuli was used to control for stimulus learning (ANT₂)

	Wk 1	Session. 1	Demographics, MAAS State, ANT ₁ , ANT ₂
		Session 2	MAAS State, Intervention, MAAS State, ANT ₁
	Wk 2	S 3 & 4	MAAS State, Intervention, MAAS State, ANT ₁
	Wk 3	S. 5 & 6	MAAS State, Intervention, MAAS State, ANT ₁
	Wk 4	S. 7 & 8	MAAS State, Intervention, MAAS State, ANT ₁
	Wk 5	S. 9	MAAS State, Intervention, MAAS State, ANT ₁ , ANT ₂

3. Results

Alerting (ANT₁)

Alerting Score =

Mean 'double cue' RTs - Mean 'no cue' RTs.

- Alerting scores of session1 & 9 show a two-way interaction by session and intervention, F(2, 54)=3.13; p=0.05, $\eta p^2=.104$ Meditation and Colouring groups show maintained alerting scores
 - Video group show increased alerting scores

Filtered by reported extra mindfulness practice:

- Alerting scores (session 1 & 9) show a two-way interaction by session and intervention, $F(2, 29)=3.89; p=.03, \eta p^2=.212 (N=32)$
- ❖ Effects were not found in the ANT₂

State Mindfulness Scores

- ❖ There was a two-way interaction by session, pre/post intervention and intervention, F(2, 76)=4.37, p=.021, $\eta p^2=.175$
 - Colouring and Meditation groups became more mindful post intervention

4. Discussion

- Alerting may be manipulated over only a few short sessions
- Colouring conditions showed similar effects to Meditation
 - Unclear which element(s) of the two tasks created similar effects
- ❖ Findings converge with previous studies (MacLean et al., 2010)
 - Mindfulness can help you stay alert (improve sustained voluntary attention)
- Effects may not have been found in the ANT with alternative stimuli as the effects of the intervention may not have lasted that long

5. Where Next?

- Break down of the Colouring condition
 - Splitting the elements of the Colouring task should help to identify the elements that are leading to maintained alerting scores
 - These could then be compared to mindfulness
 Meditation

Want to give colouring a go?

Here's what to do: first grab a pattern...

Sit **comfortably** & allow yourself to focus on the pattern.

Move your **focus** to the lowest point of the pattern.

Slowly spread your awareness up the **pattern**,

until the whole pattern is in your awareness

Pick an area and

start to colour...

Questions you may have...

- 1. What were the major problems that you encountered?
- 2. What meditation exercises did you use?
- 3. What do you mean by 'filtered by extra mindfulness practice'?
